

## ABSTRACT OF THE DISCLOSURE

Interior rear-view mirror for motor vehicles. Interior rear-view mirrors for motor vehicles are known in whose mirror housing is arranged a speaker. However, the sound they produce frequently does not satisfy sound quality requirements in motor vehicles. So that the interior rear-view mirror ensures high quality of sound reproduction from its speaker while being easy to assemble, the speaker is part of a bass reflex system that is accommodated in the mirror housing. The result of this design is optimum sound quality. The bass reflex system can simply be built into the mirror housing with no additional installation space required. The interior rear-view mirror is installed in motor vehicles.
